Foreword

Hello everybody! I am Aleksandr or Innocent Soul, the dev of the Lost Wish: In the desperate world. This is the first game I've been working on, so I am really happy to finally release it. At first, I had two friends to make the game with me, but they declined to make it till the end. Actually, one of them made some original soundtracks for the game, so it was a big help. Anyway, we've wanted to make a visual novel at first (lol), but in the process a lot of things changed. The game even changed its genre, so a lot of plot details are cut off. Yes, even though I've wanted to make a plot-focused platformer, it's more like now into the lore, not the direct storytelling.

I like playing games, I like indie games, so that's why I decided to make one. I didn't have a lot of time to play lately since I'm busy with studying and trying to find a possible job, though. Anyway, I'm glad I am able to make something people would like. I've received some letters on my mail even before the game actually launched, so yes, development of this game was a right choice.

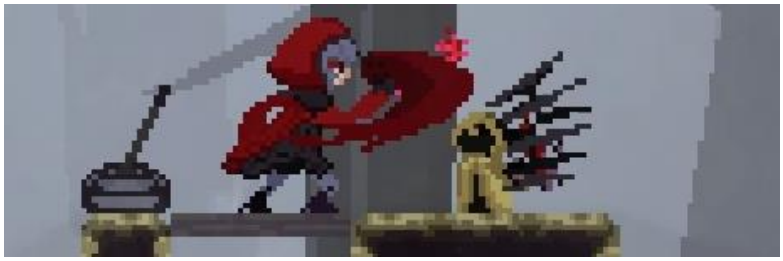
As you can say from my name, English is not my native language. I hope I haven't done a lot of mistakes in the text of the game.

Gameplay

The GUI is showing you an HP bar, a square with an active usable item, amount of shards (number at center) and amount of healing flasks (number at bottom) you have at the moment.

Most of the key features are told through the plates with tips. You can interact with them (and almost everything interactive) by pressing the UP button.

To defeat enemies, you have to attack them. Your attacks are combined into a combo of 3 hits, where the first hit have the least amount of damage, when the third hit have the largest amount of damage. Jump attack is equal to second attack.



When you defeat enemies, open chests or complete some small quests, you will gain shards. You can use them to buy items in shops (every shopkeeper has different items). Also, when you pick up a shard, a small amount of health will be restored.

These were the basics of the game. Anything else should be more or less understandable when you reach a certain point. Don’t hesitate to set easy mode if it’s hard to you, send bug reports if you find any and check steam guides (I will write one).

Plot

It’s a dark fantasy medieval. People hate vampires and fear them. Kana, the main character, is the girl who hated vampires with all her heart, but she changes her opinion after some events… Even if she become a bit softer, she is still following her path of revenge. But the far she goes, the more questions she gets.

Key characters

Kana is the main character of the game. She’s been through a lot, even though she is still young. She lived a hard life without being able to rest, she spent all her youth to be able to kill her enemies. Only one person was able to make her softer. Maybe even too soft.

Alice is Kana’s friend, who helped her when she was in trouble. Kana once said, Alice is the last kind person in the whole world. It may be true, may be not, but at least that means Kana haven’t met good people before.

System

MINIMUM:	RECOMMENDED:
OS: Windows 7	OS: Windows 10 (64 bit)
Processor: Anything with 2.2 GHz	Processor: Anything better
Memory: 1 GB RAM	Memory: 2 GB RAM
Graphics: Intel HD	Graphics: Anything better
Storage: 100 MB available space	Storage: 100 MB available space
Sound Card: Anything	Sound Card: Anything
Additional Notes: Pretty light game. If some kind of effect is causing FPS drops, it is most likely you can turn it off in options.	

The game is pretty light. Even old computers should launch it well, but if for some reason you have any frame rate drops, you can turn off additional effects in settings (these effects are shown only in some rooms, where they are used).

If the game has problems with playing audio, check the audio output device and update drivers for your sound card.

If the sounds work well, but there isn't any video output, update your video card drivers. If you are playing from an old PC, maybe the card is not supported at all.

If you are using not a 64-bit system or an old PC, the game may work slowly. Try to turn off any other programs you are using.
